BINDS TO IL-5.

C -!- SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA CHAIN. THE BE CHAIN IS COMMON TO THE IL-3, IL-5 AND GM-CSF RECEPTORS.

C -!- SUBCELLULAR LOCATION: Type I membrane protein.

C -!- ALTERNATIVE PRODUCTS: 3 ISOFORMS; MEMBRANE-BOUND FORM (SHERE), SOLUBLE FORM S1 AND SOLUBLE FORM S2; ARE PRODUCED ALTERNATIVE SPLICING.

C -!- TISSUE SPECIFICITY: EXPRESSED ON EOSINOPHILS AND BASOPHIL C -!- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.

C -!- SIMILARITY: TO IL-13 RECEPTOR ALPHA-2 CHAIN.

                                                                                                                                                                                                          "Cloning and characterization of a binding subunit of the interleukin 13 receptor that is also a component of the interleukin 4 receptor."; Proc. Natl. Acad. Sci. U.S.A. 93:497-501(1996).

C -! FUNCTION: BINDS IL-13 WITH A LOW AFFINITY. TOGETHER WITH IL-4R-
C ALPHA CAN FORM A FUNCTIONAL RECEPTOR FOR IL-13. ALSO SERVES AS AN ALTERNATE ACCESSORY PROTEIN TO THE COMMON CYTOKINE RECEPTOR GAMMA C IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY (BY STATIARITY).

C GAMMA-C IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY (BY SIMILARITY).

C SUBUNIT: INTERLEUKIN-13 RECEPTOR IS A COMPLEX OF IL4R-ALPHA, CLIBA-ALPHA, AND POSSIBLY OTHER COMPONENTS (BY SIMILARITY).

C TESTIS. STOMACH, BRAIM, SKIN, AND COLON. BUT NOT SKELETAL MUSCLE.

TESTIS. STOMACH, BRAIM, SKIN, AND COLON. BUT NOT SKELETAL MUSCLE.

SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-NOV-1997 (Rel. 35, Created)

-!- FUNCTION: BINDS IL-13 WITH A LOW AFFINITY. TOGETHER WITH IL-4R-ALPHA CAN FORM A FUNCTIONAL RECEPTOR FOR IL-13. ALSO SERVES AS AN ALPHA CAN FORM A FUNCTIONAL RECEPTOR FOR IL-13. ALSO SERVES AS AN ALTERNATE ACCESSORY PROTEIN TO THE COMMON CYTOKINE RECEPTOR GAMMA CHAIN FOR IL-4 SIGNALING, BUT CANNOT REPLACE THE FUNCTION OF CHAIN FOR IL-4 SIGNALING, BUT CANNOT REPLACE THE FUNCTION OF GAMMA-C IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY.

--- SUBUNIT: INTERLEUKIN-13 RECEPTOR IS A COMPLEX OF IL4R-ALPHA, IL13R-ALPHA, AND POSSIBLY OTHER COMPONENTS.

--- SUBCELLULAR LOCATION: Type I membrane protein.

--- TISSUE SPECIFICITY: UBIQUITOUS. HIGHEST LEVELS IN HEART, LIVER, SKELETAL MUSCLE AND OVARY; LOWEST LEVELS IN BRAIN, LUNG AND KIDNEY. ALSO FOUND IN B-CELLS, T-CELLS AND ENDOTHELIAL CELLS.

--- SIMILARITY: CONTAINS 1 IMMUNOCLOBULIN-LIKE C2-TYPE DOMAIN.

--- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.

--- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.

--- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.

--- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.

--- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. Neurooncol. 26:231-239(1995).
- FUNCTION: COMMON SUBUNIT FOR THE RECEPTORS
INTERLEUKINS.
SUBUNIT: THE GAMMA CHAIN IS COMMON TO THE IL-2,
AND PROBABLY ALSO THE IL-13 RECEPTORS.
SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF R
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      musculus (Mouse)

SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: IN MOUSE THERE ARE TWO CI
RECEPTORS. ONE CONTAINS THIS IL-3-S
OTHER CONTAINS THE BETA CHAIN ALSO
AND GM-CSF RECEPTORS.

SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA CHAIN. THE BE
CHAIN IS COMMON TO THE IL-3, IL-5 AND GM-CSF RECEPTORS.
SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
DATABASE: NAME-PROW; NOTE-CD guide CDw-131 entry;

II-13 receptors are also useful as antisense molecules for gene therapy (blocking synthesis of IL-13R). Antibodies are used (in standard immunoassays) to diagnose diseases associated with abnormal expression of IL-13 receptors; when coupled to a toxin also for treatment of overproduction of IL-13R. Cells that express IL-13R at the surface are used to identify ligands and modulators of IL-13R. Note: IL-13R beta is encoded by the nucleic acid sequence shown in Figure 2a in the specification (AAT86464), which is not the same as that shown in the sequence listing (AAT85828).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             affinity, but acquires high affinity when associated with the IL-4 receptor. Nucleic acids encoding II-137 beta and alpha are used as diagnostic probes to identify aberrant synthesis or genetic anomalies such as loss of heterozygosity and rearrangements, or chromosomal anomalies. They are also used for production of recombinant II-138 beta and alpha which can be used as IL-13 antagonists, specifically to regulate IL-13-induced responses for treatment of inflammation and

                                                                                                                                                                                                                                                                                                                                         The present sequence represents the human interleukin-13 (IL-13) binding CC chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a CC mediator of the known biological activities of IL-13. Recombinant CC IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used CC to treat IgE-mediated conditions, e.g. allergy, asthma and immune complex CC disorders, especially lupus, nephritis, thyroiditis and Grave's disease. CC They are also used to treat immune deficiency (particularly in the activity is combined with IL-13bc and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein CC with such activity is combined with IL-13bc and the mixture applied, CC in vivo, to a cell expressing at least one chain of the IL-13 receptor CC cother than IL-13bc. Can also be used in diagnosis to detect CC expression of IL-13, its receptor or binding chain, and to raise specific CC antibodies which may be useful for treating some tumours.

This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and was isolated from human placental polyA+ RNA. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of II-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of
                                                                                                                                                  Claim 2;
                                                                                                                                                                      New nucleic acid encoding testis-specific cytokine receptor - use for identification of ligands or antagonists, potentially for use male contraceptives or for infertility treatment

Its amino acid consequence was deduced from a cDNA clone (see AAV04131) obtained from a chuman testis library. Recombinant HR-1 receptor can be expressed in claimed host cells, and used in a claimed method for identifying compounds which bind to, and activate or inhibit, it. HR-1 receptor activators and agonists can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoietic disorders, e.g. where induced by AIDS, aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. HR-1 antagonists, e.g. antibodies or HR-1 receptor fragments, can be used to treat conditions associated with HR-1 receptor overexpression. The antibodies can also be used to determine HR-1 receptor levels, since overexpression may be diagnostic of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid sequence encoding human cytokine peptide hormone receptor - useful to treat, prevent or diagnose, e.g. lowered resistance to infection, asthma, allergy or haematopoietic disease

receptor, designated HR-1 receptor. The amino acid sequence was deduced from a cDNA clone (see AAVOA075) isolated from a human test is cDNA library. It shows 27% amino acid identity and 52% similarity with the human interleukin-5 receptor. Also claimed are polynucleotides encoding HR-1 receptor, vector and host cells, an agonist to the polypeptide, antibody against the polypeptide, an atlagonist that inhibits the activity of the polypeptide, an antagonist that inhibits the activity of the polypeptide, a process for diagnosing a disease, or a susceptibility to disease, related to expression of HR-1 receptor, and a method for identifying compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, biological, diagnosis and (gene) therapy applications, e.g. to increase resistance to infections in individuals with trauma and/or burns, and to prevent, ameliorate, treat, diagnose and/or determine predisposition to asthma, allergic disorders or disorders of cyclic neutropaenia or as a consequence of cytotoxic therapy of cancer, lymphoma, leukaemia and/or bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                               Best Local

                                                                                                                                                            DNA encoding human cytokine-peptide hormone receptor - use treating preventing or diagnosing, e.g. lowered resistance infection, asthma, allergy, or haematopoietic disease
                  receptor, e.g. antibodies or fragments of it may be used to treat conditions associated with overexpression of the HR-1 receptor, e.g. those listed above. Antibodies may also be used to assay levels of HR-1 receptor, overexpression of which may be diagnostic of tumours, by usual immunoassays; to isolate and identify HR-1 receptor-expressing cells; or for affinity purification of the HR-1 receptor.
                                                                         The sequence is that of the human cytokine/peptide hormone receptor (HR-1 receptor). This, or it's activators or agonists, can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoietic disorders, e.g. where induced by acquired immune deficiency syndrome (AIDS), aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. Antagonists of the
                                                                                                                                                                                                                                                   (HUMA-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of the interleukin-13 binding chain (IL-13bc) of the human IL-13 receptor, as deduced from an isolated human testis cDNA clone (see AAA77912). IL-13bc is a member of the haematopoietin receptor family that acts as a mediator of IL-13. The invention provides methods for the recombinant production of IL-13bc polypeptides, including claimed full-length IL-13bc, its extracellular domain, and its intracellular domain. IL-13bc polypeptides, particularly soluble IL-13bc polypeptides, and IL-13 receptor inhibitors (e.g. antagonists of the interaction of IL-13 and its receptor) can be used to treat conditions and which IL-13 implicated, particularly IgE-mediated conditions and diseases including atoms antagonisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (e.g. lupus, nephrotic syndrome, nephritis, glomerulonephritis, thyroiditis and Grave's disease), lung inflammation, immunodeficiency, and cancer. Since II-13 inhibits macrophage activation, II-13bc proteins can also be used to enhance macrophage activation, e.g. in vaccination, treatment of mycobacterial or intracellular organisms or parasite infections. II-13bc proteins may also be used to potentiate the effects of II-13 in vitro and in vivo, as diagnostic agents, and to screen for agents capable of binding to II-13bc or II-13 receptor, or which interfere with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 11(d); Page 53-54; 60pp; English
